Breakdown of Chapter 15 Study Guide Answers I to the Digestive System What is the role of the digestive system The digestive system is responsible for breaking down food into smaller molecules that can be absorbed by the body and used for energy growth and repair What are the key processes involved in digestion Digestion involves Ingestion Taking food into the mouth Mechanical Digestion Physically breaking down food into smaller pieces chewing churning Chemical Digestion Using enzymes to break down large food molecules into smaller ones Absorption Movement of digested nutrients from the digestive tract into the bloodstream Elimination Removal of undigested food waste from the body as feces 3 II Anatomy of the Digestive System What are the organs of the digestive system The main organs include Mouth Where digestion begins with mechanical and chemical breakdown Pharynx Connects the mouth to the esophagus Esophagus A muscular tube that transports food from the pharynx to the stomach Stomach A muscular sac that mixes and churns food and initiates protein digestion Small Intestine The primary site for absorption of nutrients Large Intestine Absorbs water and forms feces Rectum Stores feces before elimination Anus The opening at the end of the digestive tract where feces are expelled What are the accessory organs of the digestive system These organs support digestion but do not directly process food They include Salivary Glands Secrete saliva which moistens food and contains enzymes that begin carbohydrate digestion Liver Produces bile which aids in fat digestion Gallbladder Stores and concentrates bile Pancreas Produces digestive enzymes and hormones that regulate blood sugar III Physiology of Digestion Describe the process of mechanical digestion Mechanical digestion involves physical breakdown of food into smaller pieces Mouth Chewing by teeth Stomach Churning and mixing of food by muscular contractions Describe the process of chemical digestion Chemical digestion involves using enzymes to break down large molecules Mouth Salivary

amylase begins carbohydrate digestion Stomach Pepsin breaks down proteins Small Intestine Pancreatic enzymes amylase lipase protease digest carbohydrates fats and proteins Small Intestine Enzymes from the intestinal lining further digest food What is absorption and where does it mainly occur Absorption is the movement of digested nutrients from the digestive tract into the bloodstream It primarily occurs in the small intestine which has a large surface area due to villi and microvilli Explain the process of elimination After nutrients are absorbed undigested food waste and water are moved into the large intestine Water is absorbed and feces are formed Feces are stored in the rectum and eliminated through the anus 4 IV Digestive Enzymes What are enzymes and why are they important in digestion Enzymes are biological catalysts that speed up chemical reactions In digestion enzymes break down large food molecules into smaller ones that can be absorbed What are the main types of digestive enzymes and what do they digest Amylase Digests carbohydrates Lipase Digests fats Protease Digests proteins Where are digestive enzymes produced Enzymes are produced in various organs including the salivary glands stomach pancreas and small intestine V Common Digestive Disorders and Diseases What are some common digestive disorders Common disorders include HeartburnGERD Acid reflux from the stomach into the esophagus Peptic Ulcers Sores in the stomach lining caused by bacteria or medications Irritable Bowel Syndrome IBS A common disorder that affects the large intestine causing
